5 The present invention furthermore relates to herbicidally effective 3-phenyluracils of the general formulae Ia and Ib

Ia

Ib

10 in which R^3 is C_1-C_6 -alkyl, C_3-C_6 -alkenyl or C_3-C_6 -alkynyl.

The present invention furthermore relates to herbicides, pesticides and plant growth-regulating agents which contain these compounds as active ingredients.

15 U.S. Patent 4,979,982 discloses herbicidal 3-phenyluracils of the formula I'

I'

where R^a is hydrogen or halogen, R^b is C_1-C_{12} -alkyl or cycloalkyl and R^c is C_1-C_{12} -alkyl or C_3-C_{12} -alkenyl.

20 Furthermore, EP-A 408 382 describes, inter alia, structures of the formula I''

I''

5 where R^d is hydrogen, alkyl, hydroxymethyl or haloalkyl, R^e is haloalkyl, R^f is hydrogen, alkyl, haloalkyl, hydroxymethyl, halogen or nitro, X¹ is oxygen or sulfur, R^g is hydrogen, alkyl, alkoxy or alkoxyalkyl and R^h is hydrogen, alkyl, cycloalkyl, haloalkyl, phenyl or benzyl and Rⁱ is halogen, nitro or cyano.

Moreover, Swiss Patent 482,402 relates to weed killers which contain as active ingredients, inter alia, substituted uracils and thiouracils of the formula I'''

10

I'''

15

20

where Aryl is aryl which is unsubstituted or substituted by fluorine, chlorine, bromine, hydroxyl, alkoxy, cyano, alkylthio, alkyl or nitro, R^k is dialkylphosphoryl, alkyl, alkenyl, cyano, hydrogen, unsubstituted or substituted alkyl, unsubstituted or substituted carbamoyl, unsubstituted or substituted thiocarbamoyl, unsubstituted or substituted mercapto or acyl, R^l is alkyl, alkoxy, hydrogen, chlorine or bromine and R^m is alkylthio, alkoxy, alkylthioalkyl, alkenyl, cyano, thiocyno, nitro, halogen, hydrogen or unsubstituted or substituted alkyl or R^l and R^m together form a tri-, tetra- or penta-methylene chain.

25

Other 3-aryltriazine-2,4-dione compounds of the same type as compounds I are disclosed, for example, in the following publications: EP-A 195 346, EP-A 260 621, EP-A 438 209, WO 88/10254, WO 89/02891 and WO 89/03825.

The selectivity of these known herbicides with respect to the weeds is, however, satisfactory only to a limited extent, so that it is an object of the present invention to provide novel herbicidal compounds with which the weeds can be selectively controlled more effectively than in the past (and which are well tolerated by the crops).

This object is achieved by the substituted 3-phenyluracils I, Ia and Ib defined at the outset.

Herbicides have also been found which contain these substances and have a good herbicidal action. They are tolerated and hence selective in broad-leaved crops and in monocotyledon plants which are not members of the Gramineae.

The novel compounds I, Ia and Ib are also suitable as defoliants or desiccants in, for example, cotton, potatoes, rape, sunflowers, soybeans or field beans. Some compounds I can also be used for controlling pests, in particular insects.

The meanings stated above for R^1 to R^{17} are general terms for an individual list of the specific group members. Compounds I in which X^1 and X^2 are each oxygen, R^1 is halogen, R^2 is hydrogen or fluorine, R^3 and R^4 are each C_1 - C_6 -alkyl or partially or completely halogenated C_1 - or C_2 -alkyl and R^5 is hydrogen, or R^4 and R^5 together form a tetramethylene chain, are very particularly preferred.

The substituted 3-phenyluracils are obtainable by various methods, preferably by one of the following processes:

- a) Cyclization of an enamine ester of the formula II or of an enamine-carboxylate of the formula III

L^1 is low molecular weight alkyl, preferably C_1 - C_4 -alkyl, or phenyl.

As a rule, the reaction is carried out in an inert solvent or diluent, preferably in the presence of a base.

Suitable solvents or diluents are inert aprotic organic solvents, for example aliphatic or cyclic ethers, such as 1,2-dimethoxyethane, tetrahydrofuran and dioxane, aromatic hydrocarbons, such as benzene, toluene and xylenes, and inert polar organic solvents, such as dimethylformamide or dimethyl sulfoxide, or water, and the polar solvents may also be used as a mixture with a nonpolar hydrocarbon, such as n-hexane.

Preferred bases are alkali metal alcoholates, in

particular sodium alcoholates, such as sodium methylate, and sodium ethylate, alkali metal hydroxides, in particular sodium hydroxide and potassium hydroxide, alkali metal carbonates, in particular sodium carbonate and potassium carbonate, and alkali metal hydrides, in particular sodium hydride.

When sodium hydride is used, the solvent is particularly preferably an aliphatic or cyclic ether, such as tetrahydrofuran, as well as dimethylformamide and dimethyl sulfoxide.

The amount of base is preferably from 0.5 to 2 times the molar amount, based on the amount of II or III.

In general, a reaction temperature of -78°C to the boiling point of the reaction mixture, in particular from -60 to 60°C , is advisable.

Depending on the nature of the base used, products I in which R^3 is hydrogen are present, after the cyclization, in the form of the corresponding metal salt of the general formula Ic

(M^+ = one equivalent of a metal ion, in particular an alkali metal ion, such as sodium), for example in the form of the corresponding alkali metal salt in the case of the abovementioned preferred bases containing an alkali metal. The salt can be isolated and purified in a conventional manner, for example by recrystallization.

Products I in which R^3 is hydrogen are obtained by acidifying the reaction mixture obtained after the cyclization, for example with hydrochloric acid.

b) Alkylation or acylation of a substituted 3-phenyluracil I in which R^3 is hydrogen

The alkylation is usually carried out with a halide, preferably with the chloride or bromide, or with the sulfate of an alkane, of an alkene, of an alkyne, of a cycloalkane, of a cyanoalkane, of a haloalkane, of a phenylalkane or of an alkoxyalkane.

Examples of suitable acylating agents are formyl halides, alkanecarbonyl halides or alkoxy carbonyl halides, the chlorides and bromides being preferred in each case.

The alkylation is advantageously carried out in the presence of an inert organic solvent and of a base, for example in a protic solvent, such as a lower alcohol, preferably ethanol, if necessary as a mixture with water, or in an aprotic solvent, such as an aliphatic or cyclic ether, preferably 1,2-dimethoxyethane, tetrahydrofuran or dioxane, an aliphatic ketone, preferably acetone, an amide, preferably dimethylformamide, or a sulfoxide, preferably dimethyl sulfoxide.

In a particularly preferred embodiment, the cyclization product (method a) present as a salt is alkylated without prior isolation from the reaction mixture, and in this case excess base, for example sodium hydride, a sodium alcoholate or sodium carbonate, originating from the cyclization of the compound II or III may also be present. However, this base has no adverse effect; if desired, a further amount of the diluent which was also used for the cyclization of the compound II or III may also be added.

The acylation with a halide can be carried out in a similar manner, the reaction particularly preferably being carried out in this case in an aprotic solvent and in the presence of sodium hydride as base.

The reaction temperature is in general from 0 to about 100°C, preferably from 0 to 40°C.

c) Substitution of a halogen atom in the phenyl moiety of the substituted 3-phenyluracils I (R^1 = halogen) by the cyano group

Hal is halogen, preferably chlorine or bromine.

The reaction is advantageously carried out in the presence of an aprotic, polar solvent, for example of an alkylnitrile, such as acetonitrile, propionitrile or butyronitrile, of an alkylurea such as N,N,N',N'-tetramethylurea, of a dialkylamide, such as dimethylformamide, or of a dialkyl sulfoxide, such as dimethyl sulfoxide, or in N-methyl-2-pyrrolidone, 1,2-dimethylimidazolidin-2-one, 1,2-dimethyl-3,4,5,6-tetrahydro-2(1H)-pyrimidinone or hexamethylphosphorotriamide.

The reaction is usually carried out using a metal cyanide, in particular a transition metal cyanide, such as copper(I) cyanide, at elevated temperatures, preferably at from 150 to 250°C.

The starting materials are advantageously used in stoichiometric amounts, but an excess of metal cyanide, for example up to 4 times the molar amount (based on the amount of starting material I in which R^1 is halogen),

may also be advantageous.

d) Conversion of a pyrimidone derivate of the formula
IVa or IVb into an enol ether Ia or Ib

Hal is chlorine or bromine;

Me[⊕] is one equivalent of a metal ion, in particular of a transition metal ion, of an alkali metal ion, such as sodium or potassium, or of an alkaline earth metal ion, such as calcium or magnesium.

Sodium is particularly preferred.

15 The reaction of the pyrimidone derivatives IVa or IVb with alkanols, alkenols, alkynols (R^{3'}-OH) or alkanethiols, alkenethiols or alkynethiols (R^{3'}-SH) is advantageously carried out in the presence of an organic base, pyridine being particularly preferred.

20 The amount of base is not critical; usually, from 0.5 to 2 times the molar amount, based on the amount of IVa or IVb, is sufficient.

25 The reactions of IVa with H-X¹-R^{3'} and of IVb with H-X²-R^{3'} can be carried out either in the absence of a solvent in an excess of R^{3'}-OH or R^{3'}-SH or in a suitable inert organic solvent, for example in an aromatic, such as toluene or xylene, in an ether, such as diethyl ether, tetrahydrofuran or 1,2-dimethoxyethane, or in a halo-

hydrocarbon, such as dichloromethane or chlorobenzene.

When the compound $R^{3'}-OH$ is used, the reaction is preferably carried out in the absence of a solvent, using from 1 to about 150 times the amount, based on the amount of pyrimidone derivative IVa or IVb, of $R^{3'}-OH$.

In the reaction with a salt of the formula $M^{\oplus} O-R^{3'}$ or $M^{\oplus} S-R^{3'}$, it is advisable to use equimolar amounts of pyrimidone derivative and salt, but an excess of the salt of up to about 20 mol % (based on the amount of pyrimidone derivative) may also be advantageous.

A reaction temperature of from 0 to 50°C, preferably from 10 to 30°C, is usually sufficient.

If they cannot be prepared directly by the cyclization under basic conditions, described as method a), the salts of the compounds I in which R^3 is hydrogen can also be obtained in a conventional manner from the products of the present method d). For this purpose, for example, the substituted 3-phenyluracil I in which R^3 is hydrogen is added to the aqueous solution of an inorganic or an organic base. The salt formation usually takes place at a sufficient rate at as low as 20-25°C.

It is particularly advantageous to prepare the sodium salt by dissolving the 3-phenyluracil I (R^3 = hydrogen) in aqueous sodium hydroxide solution at 20-25°C, equivalent amounts of 3-phenyluracil and sodium hydroxide being used. The salt of the 3-phenyluracil can then be isolated, for example, by precipitation with a suitable inert solvent or by evaporating off the solvent.

Salts of the 3-phenyluracils whose metal ion is not an alkali metal ion can usually be prepared by double decomposition of the corresponding alkali metal salt in aqueous solution. Water-insoluble metal salts of 3-phenyluracil can generally be prepared in this manner.

e) Acetalation of a compound I in which W is $-C(=O)-R^8$

I (W = $-C(R^8)=O$)

I (W = $-C(R^8)(X^3R^6)(X^4R^7)$)

The acetalation is generally carried out in an inert aprotic organic solvent, for example in an aliphatic or cyclic ether, such as diethyl ether, 1,2-dimethoxyethane, tetrahydrofuran or dioxane, in an aromatic hydrocarbon, such as benzene or toluene, o-, m- or p-xylene or mesitylene, or in a chlorohydrocarbon, such as methylene chloride, chloroform or chlorobenzene, unless it is effected in the absence of a solvent in an excess of $H-X^3R^6$, $H-X^4R^7$ or $H-X^3(R^6R^7)X^4-H$.

Any water of reaction formed can be removed in a conventional manner from the reaction mixture, for example by means of a water separator.

The acetalation is preferably carried out in the presence of an organic acid, such as p-toluenesulfonic acid, and/or of a Lewis acid, such as tin tetrachloride, tin(II) chloride, iron(III) chloride, tellurium tetrachloride or boron trifluoroetherate, or of a suitable catalyst, such as montmorillonite K 10, the amount of acid usually being from 0.5 to 100 mol %, based on the amount of starting material to be acetalated.

The ratios are not critical. For complete conversion, all reactants are used in about a stoichiometric ratio, but an excess of $H-X^3R^6$ and $H-X^4R^7$ or $H-X^3(R^6R^7)X^4-H$ is preferably used.

If the starting materials $H-X^3R^6$ and $H-X^4R^7$ or $H-X^3(R^6R^7)X^4-H$ are used simultaneously as diluents, they are present in a larger excess.

The reactions are carried out in general at from -78 to 180°C, preferably from -40 to 150°C.

If product mixtures are obtained, for example when R^6 and R^7 do not form a common radical and X^3R^6 and X^4R^7 are not identical, they can, if desired, be purified and separated by conventional methods, such as crystallization and chromatography.

In particular, compounds of the formula I where W is $-C(R^8)(X^3R^6)(X^4R^7)$, R^6 and R^7 do not form a common radical and X^3R^6 and X^4R^7 are not identical can also be prepared by other methods known from the literature (cf. for example Tetrahedron Lett. 32 (1991), 467-470, and the literature cited there).

f) Acetal cleavage of a compound I in which W is $-C(R^8)(X^3R^6)(X^4R^7)$

The acetal cleavage can be carried out without the addition of an acid, in the presence of an acid, for example of a mineral acid, such as hydrochloric acid and sulfuric acid, or of an organic carboxylic acid, such as
5 formic acid, acetic acid, oxalic acid or trifluoroacetic acid, in the presence of an acidic ion exchanger, such as Amberlite® (trade mark of Aldrich) IR120 or IRC84, or in the presence of a transition metal salt, such as mercury(II) oxide, copper(I) oxide or iron(III) chloride.

10 Examples of suitable solvents or diluents are aromatics, such as benzene, toluene and o-, m- and p-xylene, aliphatic or cyclic ethers, such as 1,2-dimethoxyethane, diethyl ether, tetrahydrofuran and dioxane, alcohols, such as methanol, ethanol and iso-
15 propanol, polar organic solvents, such as dimethylformamide, dimethyl sulfoxide and acetonitrile, ketones, such as acetone and butanone, and water.

The reaction is preferably carried out in the absence of a solvent in an excess of the acid used for
20 the acetal cleavage, formic acid being particularly preferred.

For complete conversion, the starting materials I in which W is $-C(R^8)(X^3R^6)(X^4R^7)$ and H_2X^5 are used in at least a stoichiometric ratio, but an excess of H_2X^5 of up
25 to about 200 mol % is also possible.

The amount of acid, ion exchanger or transition metal salt is not critical. In general, up to about 300 mol %, based on the amount of H_2X^5 , is sufficient.

30 As a rule, the reaction temperature is from -78 to 180°C, preferably from 0°C to the boiling point of the particular diluent.

Further methods which can be used for the preparation of the substituted 3-phenyluracils I are described in Houben-Weyl, Handbuch der Org. Chemie, 4th
35 Edition, Vol. E3, page 362 et seq.

g) Olefination of compounds I ($W = -C(R^8)=O$)

I (W = -C(R⁸)=O)

Phosphorylide V
phosphonium salt VI
or phosphonate VII

I

(W = -C(R⁸)=C(R⁹)-CO-R¹⁰,
-CR⁸=CR⁹-CH₂-CO-R¹⁰,
-CR⁸=CR⁹-CR¹¹=CR¹²-CO-R¹⁰,
-CR⁸=CR⁹-CH₂-CHR¹³-CO-R¹⁰)

The reaction can be carried out using the following phosphorylides Va to Vd, phosphonium salts VIA to VID and phosphonates VIIa to VIId:

5	Phosphorylides V:	R ³ P-C(R ⁸)-CO-R ¹⁰	Va,
		R ³ P-C(R ⁸)-CH ₂ -CO-R ¹⁰	Vb,
		R ³ P-C(R ⁸)-C(R ¹¹)-C(R ¹²)-CO-R ¹⁰	Vc,
		R ³ P-C(R ⁸)-CH ₂ -CH(R ¹³)-CO-R ¹⁰	Vd;
10	Phosphonium salts VI:	R ₃ P ⁺ -CH(R ⁹)-CO-R ¹⁰	Hal ⁺ VIA,
		R ₃ P ⁺ -CH(R ⁹)-CH ₂ -CO-R ¹⁰	Hal ⁺ VIB,
		R ₃ P ⁺ -CH(R ⁹)-CR ¹¹ -CR ¹² -CO-R ¹⁰	Hal ⁺ VIC,
		R ₃ P ⁺ -CH(R ⁹)-CH ₂ -CHR ¹³ -CO-R ¹⁰	Hal ⁺ VID;
15	Phosphonates VII:	(RO) ₂ PO-CH(R ⁹)-CO-R ¹⁰	VIIa,
		(RO) ₂ PO-CH(R ⁹)-CH ₂ -CO-R ¹⁰	VIIb,
		(RO) ₂ PO-CH(R ⁹)-CR ¹¹ -CR ¹² -CO-R ¹⁰	VIIc,
		(RO) ₂ PO-CH(R ⁹)-CH ₂ -CHR ¹³ -CO-R ¹⁰	VIId.

Those phosphorylides Vb and Vd, phosphonium salts VIB and VID and phosphonates VIIb and VIId in which R¹⁰ is hydrogen, alkyl or cycloalkyl are not very suitable.

The radicals R on the phosphorus may be identical or different and are, for example, branched or straight-chain C₁-C₈-alkyl, C₃- or C₆-cycloalkyl and in particular phenyl which may carry further substituents which are inert for the reaction, for example C₁-C₄-alkyl, such as methyl, ethyl or tert-butyl, C₁-C₄-alkoxy, such as methoxy, or halogen, such as fluorine, chlorine or bromine. Unsubstituted phenyl radicals are preferred since the starting material triphenylphosphine used for the preparation of the phosphorylides V and phosphonium salts VI is particularly economical and furthermore the

very unreactive, solid triphenylphosphine oxide which can be readily separated off is formed in the reactions.

For example, the methods described in Houben-Weyl, Methoden der Organischen Chemie, Volume E2, 1982, page 345 et seq. are suitable for the preparation of the phosphonates VII.

Suitable solvents are inert organic solvents, for example aromatics, such as toluene and o-, m- and p-xylene, ethers, such as 1,2-dimethoxyethane, diethyl ether, tetrahydrofuran and dioxane, polar organic solvents, such as dimethylformamide and dimethyl sulfoxide, or alcohols, such as methanol, ethanol and isopropanol.

In the olefination of I where W is $-C(R^8)=O$ with a phosphonium salt VI or a phosphonate VII, the reaction is carried out in the presence of a base, alkali metal alkyls, such as n-butyllithium, alkali metal hydrides and alcoholates, such as sodium hydride, sodium ethylate and potassium tert-butyrate, and alkali metal and alkaline earth metal hydroxides, such as calcium hydroxide, being particularly suitable.

For complete conversion, all reactants are used in about a stoichiometric ratio, but an excess of base of about 10 mol % is preferably used.

In general, the reaction temperature is from -40 to 150°C.

The compounds of the formulae V, VI and VII are known or can be prepared by known methods (cf. for example Houben-Weyl, Methoden d. Org. Chemie, Vol. E1, page 636 et seq., Georg Thieme Verlag, Stuttgart, 1982, ibid. Vol. E2, page 345 et seq. and Chem. Ber. 95 (1962), 3993).

A further possibility for the preparation of 3-phenyluracils I where W is $-CR^8=CR^9-CO-R^{10}$ and R^{10} is hydrogen, alkyl, alkenyl, haloalkyl, cycloalkyl, phenyl or alkoxyalkyl is the conventional aldol condensation. Suitable conditions for this purpose are described in, for example, Nielsen, Org. React. 16 (1968), 1 et seq.

Suitable further methods for synthesizing compounds of the formula I where W is $-C(R^8)=C(R^9)-CO-R^{10}$, $-CH(R^8)=CH(R^9)-CO-R^{10}$, $-CR^8=CR^{11}-CH_2-CO-R^{12}$, $-CR^8=CR^{11}-CR^{13}=CR^{14}-CO-R^{10}$ or $-CR^8=CR^{11}-CH_2-CHR^{15}-CO-R^{12}$, and R^9 or R^{11} is hydrogen, cyano, alkoxy carbonyl or alkyl carbonyl are both the Knoevenagel condensation and the Perkin condensation. Suitable conditions are described in, for example, Org. React. 15 (1967), 204 et seq. (Knoevenagel) or Johnson, Org. React. 1 (1942), 210 et seq. (Perkin).

Compounds in which R^{10} is $-NR^{18}R^{19}$ or $-SR^{17}$ can be prepared, for example, in a conventional manner by converting compounds in which R^{10} is hydroxyl into the corresponding acyl halides (R^{10} is halogen) and subsequently reacting the products with a corresponding amine $H-NR^{18}R^{19}$ or thiol $H-SR^{17}$ or with a reactive derivative of these compounds.

h) Reaction of compounds I ($W = -C(R^8)=O$) with amines, hydroxylamines or hydrazines

The reaction is usually carried out in an inert organic solvent or diluent, for example in an aromatic, such as toluene or xylene, in a chlorohydrocarbon, such as dichloromethane, chloroform or chlorobenzene, in an ether, such as diethyl ether, 1,2-dimethoxyethane or tetrahydrofuran, in an alcohol, such as methanol or ethanol, or in a mixture of the stated solvents.

If the amines H_2N-R^{14} are in the form of salts, for example as hydrochlorides or oxalates, the addition of a base, preferably sodium carbonate, potassium carbonate, sodium bicarbonate, triethylamine or pyridine,

is preferable for their liberation.

The resulting water of reaction can, if desired, be removed from the reaction mixture by distillation or with the aid of a water separator.

5 The reaction temperature is usually from -30 to 150°C, preferably from 0 to 130°C.

i) Cleavage of compounds I where W is $-C(R^8)=N-R^{14}$

10 The cleavage reaction is carried out in the absence of a solvent or in an inert solvent or diluent with water or a reactive derivative of water.

The reaction can be carried out by hydrolysis or under oxidative conditions, a reaction temperature of from -78 to 180°C, preferably from 0°C to the boiling point of the diluent being preferable.

15 Examples of suitable solvents or diluents are aromatics, such as benzene, toluene and o-, m- and p-xylene, chlorinated hydrocarbons, such as dichloromethane, chloroform and chlorobenzene, ethers, such as dialkyl ether, 1,2-dimethoxyethane, tetrahydrofuran and dioxane, alcohols, such as methanol and ethanol, ketones, such as acetone, esters of organic acids, such as ethyl acetate, or water and mixtures of the stated solvents.

20 The reaction is advantageously carried out in the presence of a mineral acid, such as hydrochloric acid, 25 hydrobromic acid or sulfuric acid, of a carboxylic acid, such as acetic acid or trifluoroacetic acid, or of a sulfonic acid, such as p-toluenesulfonic acid.

In the procedure under oxidative conditions, oxidizing agents such as lead tetraacetate, sodium hypochloride and hydrogen peroxide are particularly suitable.

If desired, the reaction may additionally be carried out in the presence of a catalyst, such as copper(II) sulfate, titanium tetrachloride or boron trifluoroetherate.

The amounts of acid, oxidizing agent and catalyst may be varied within wide limits. Usually, both the amount of acid and the amount of catalyst are from 5 to 200 mol % and the amount of oxidizing agent is from 25 to 400 mol %, based on the amount of the compound to be oxidized, but they may also be used in a considerably larger excess.

k) Reaction of a substituted 3-phenyluracil I in which X^2 is oxygen with a sulfurization reagent

The reaction is carried out as a rule in an inert solvent, for example in an aromatic hydrocarbon, such as toluene or o-, m- or p-xylene, in an ether, such as diethyl ether, 1,2-dimethoxyethane or tetrahydrofuran, or in an organic amine, such as pyridine.

Particularly suitable sulfurization reagents are phosphorus(V) sulfide and 2,4-bis-(4-methoxyphenyl)-1,3,2,4-dithiadiphosphetane-2,4-dithione (Lawesson's

reagent).

The amount of sulfurization reagent is not critical; from 1 to 5 times the molar amount, based on the 3-phenyluracil to be sulfurized, is usually used.

5 The reaction temperature is usually from 20 to 200°C, preferably from 40°C to the boiling point of the solvent.

1) Halogenation of a substituted 3-phenyluracil I in which R⁵ is hydrogen

10 The halogenation is carried out as a rule in an inert organic solvent or diluent. For example, aliphatic carboxylic acids, such as acetic acid, or chlorinated aliphatic hydrocarbons, such as methylene chloride, chloroform and carbon tetrachloride, are suitable for the chlorination and bromination. Low boiling aliphatic carboxylic acids, such as acetic acid, are particularly preferred for the iodination.

15 Elemental chlorine or bromine and sulfuryl chloride or sulfuryl bromide are particularly suitable for the chlorination and bromination, a reaction temperature of from 0 to 60°C, preferably from 10 to 30°C, being preferable.

20 If desired, the chlorination and bromination can be carried out in the presence of an acid acceptor, sodium acetate and tertiary amines, such as triethylamine, dimethylaniline and pyridine, being particularly preferred.

25 Elemental iodine is a particularly preferred iodinating agent, and in this case the reaction

temperature is from 0 to 110°C, preferably from 10 to 30°C.

The iodination is particularly advantageously carried out in the presence of a mineral acid, such as fuming nitric acid.

The amount of halogenating agent is not critical; equimolar amounts of halogenating agent or an excess of up to about 200 mol %, based on the starting material to be halogenated, are usually used.

Excess iodine can be removed by means of saturated aqueous sodium bisulfite solution, for example after the reaction.

m) Reduction of a substituted 3-phenyluracil I in which W is cyano

The reaction is advantageously carried out in an inert organic solvent, for example an aromatic, such as toluene or o-, m- or p-xylene, an aliphatic or cyclic ether, such as diethyl ether, tert-butyl methyl ether, tetrahydrofuran or dioxane, a chlorohydrocarbon, such as methylene chloride, chloroform or chlorobenzene, or in an organic carboxylic acid, such as formic acid.

Examples of suitable reducing agents are hydrogen or metal salts, such as tin(II) chloride, metal hydrides, such as diisobutylaluminum hydride, diisopropylaluminum hydride, lithiumtrisethoxyaluminum hydride and lithium-bisethoxyaluminum hydride, or triethylsilane. Diisobutylaluminum hydride, formic acid or hydrogen is preferably used.

If desired, the reduction can be carried out in

the presence of a catalyst, such as triethyloxonium tetrafluoroborate or Raney nickel.

If the reaction is carried out in the absence of a diluent in formic acid as a reducing agent, the latter may also be present in a relatively large excess.

The most advantageous reaction temperature is dependent on the particular reducing agent but is in general from -78 to 150°C.

The enamine esters of the formula II which are required as starting materials are novel unless W is -CH=CH-CO-OR¹⁴ where R¹⁴ is C₁-C₆-alkyl or C₃-C₈-alkenyl when R⁴ is trifluoromethyl and R⁵ is hydrogen (cf. U.S. Patent 4,979,982). They can likewise be used as herbicides.

The enamine esters II can be prepared by known methods, for example by one of the following processes:
n)

The reaction is preferably carried out under essentially anhydrous conditions in an inert solvent or diluent, particularly preferably in the presence of an acidic or basic catalyst.

Particularly suitable solvents or diluents are organic solvents which form an azeotropic mixture with water, for example aromatics, such as benzene, toluene and o-, m- and p-xylene, halohydrocarbons, such as methylene chloride, chloroform, carbon tetrachloride and chlorobenzene, aliphatic and cyclic ethers, such as 1,2-dimethoxyethane, tetrahydrofuran and dioxane, or cyclohexane, as well as alcohols, such as methanol and ethanol.

Preferred acidic catalysts are strong mineral acids, such as sulfuric acid and hydrochloric acid, phosphorus-containing acids, such as orthophosphoric acid and polyphosphoric acid, organic acids, such as p-toluenesulfonic acid, and acidic cation exchangers, such as Amberlyst 15 (Fluka).

Examples of suitable basic catalysts are metal hydrides, such as sodium hydride, and particularly preferably metal alcoholates, such as sodium methyllate and ethyllate.

The β -ketoester VIII and the phenylurea IX are advantageously used in a stoichiometric ratio, or a slight excess of up to 10 mol % of one or other component is used.

From 0.5 to 50 mol %, based on the amount of a starting material, of a catalyst is usually sufficient.

In general, the reaction is carried out at from 60 to 120°C, or preferably at the boiling point of the reaction mixture for rapid removal of water formed.

o)

L³ is C₁-C₄-alkyl or phenyl.

This reaction can be carried out, for example, in an inert, water-miscible, organic solvent, for example an aliphatic or cyclic ether, such as diethyl ether, 1,2-dimethoxyethane, tetrahydrofuran or dioxane, or a lower alcohol, in particular ethanol, the reaction temperature usually being from 50 to 100°C, preferably the boiling point of the reaction mixture.

The reaction can, however, also be carried out in

an aromatic diluent, such as benzene, toluene or o-, m- or p-xylene, in which case the addition of either an acidic catalyst, such as hydrochloric acid or p-toluene-sulfonic acid, or of a base, for example of an alkali metal alcoholate, such as sodium methylate and sodium ethylate, is preferable. In this process variant too, the reaction temperature is usually from 50 to 100°C, preferably from 60 to 80°C.

p)

The reaction is advantageously carried out in the presence of an essentially anhydrous, aprotic, organic solvent or diluent, for example of an aliphatic or cyclic ether, such as diethyl ether, 1,2-dimethoxyethane, tetrahydrofuran or dioxane, of an aliphatic or aromatic hydrocarbon, such as n-hexane, benzene, toluene or o-, m- or p-xylene, of a halogenated, aliphatic hydrocarbon, such as methylene chloride, chloroform, carbon tetrachloride, 1,2-dichloroethane or chlorobenzene, of an aprotic, polar solvent, such as dimethylformamide, hexamethylphosphorotriamide or dimethyl sulfoxide, or of a mixture of the stated solvents.

If desired, the reaction can also be carried out in the presence of a metal hydride base, such as sodium hydride or potassium hydride, of an alkali metal or alkaline earth metal alcoholate, such as sodium methylate, sodium ethylate or potassium tert-butyrate, or of an organic tertiary base, such as triethylamine or pyridine, and the organic base may simultaneously serve as a solvent.

The starting materials are advantageously used in a stoichiometric ratio, or a slight excess of up to about

20 mol % of one or other component is used. If the reaction is carried out in the absence of a solvent and in the presence of an organic base, the latter is present in a relatively large excess.

The reaction temperature is preferably from -80 to 50°C, particularly preferably from -60 to 30°C.

q)

L¹ and L⁴ are each C₁-C₄-alkyl or phenyl.

This reaction is advantageously carried out in an aprotic, polar solvent or diluent, such as dimethylformamide, 2-butanone, dimethyl sulfoxide or acetonitrile, and advantageously in the presence of a base, for example of an alkali metal or alkaline earth metal alcoholate, in particular of a sodium alkanolate, such as sodium meth-
ylate, of an alkali metal or alkaline earth metal carbonate, in particular sodium carbonate, or of an alkali metal hydride, such as lithium hydride or sodium hydride.

Usually, from 1 to 2 times the molar amount, based on the amount of starting material, of base is sufficient.

The reaction temperature is in general from 80 to 180°C, preferably the boiling point of the reaction mixture.

Regarding the ratios of the starting materials, the statements made for method n) are applicable.

In a particularly preferred embodiment, a sodium alcoholate is used as the base, and the alcohol formed in the course of the reaction is distilled off continuously.

The enamine esters of the formula II prepared in this manner can be cyclized to a salt of the substituted 3-phenyluracils I by process variant a) without isolation from the reaction mixture.

5

r)

This reaction is advantageously carried out in the presence of an essentially anhydrous, aprotic, organic solvent or diluent, if desired in the presence of a metal hydride base, such as sodium hydride and potassium hydride, or of an organic tertiary base, such as triethylamine or pyridine, and the organic base may also serve as the solvent.

15

Regarding the suitable solvents and ratios, the statements made for method *g*) are applicable.

The reaction temperature is as a rule from -80 to 150°C, preferably from -60°C to the particular boiling point of the solvent.

20

The enamine-carboxylates of the formula III are likewise novel and can be used as herbicides. They can be prepared by conventional processes, for example from an aniline derivative of the formula XVI according to the following reaction scheme:

25

(G11)

(G12)

(G13)

In equation (G11), $R^{4'}$ and $R^{3'}$ are each hydrogen or C_1 - C_4 -alkyl.

The reactions according to equations 1 and 2 are preferably carried out in an anhydrous inert aprotic solvent, for example in a halohydrocarbon, such as methylene chloride, chloroform, carbon tetrachloride or chlorobenzene, an aromatic hydrocarbon, such as benzene, toluene or o-, m- or p-xylene, or an aliphatic or cyclic ether, such as diethyl ether, dibutyl ether, 1,2-dimethoxyethane, tetrahydrofuran and dioxane.

For the reaction of the lactone XV with the aniline derivative XVI according to equation (G11), it is preferable to add a basic catalyst, eg. 4-pyrrolidinopyridine, 4-dimethylaminopyridine, 1,2-diazabicyclo[2.2.2]octane, 1,5-diazabicyclo[4.3.0]non-5-ene, 1,8-diazabicyclo[5.4.0]undec-7-ene or diethylamine.

Since the reaction is exothermic, a reaction temperature of from -10 to 50°C , preferably from 10 to 30°C , is generally sufficient.

For the reaction of the compounds of the formulae XVIII and XVI with one another according to equation (G12), on the other hand, higher temperatures, for example from 70 to 140°C , in particular from 100 to 120°C , are advantageous.

The reaction according to equation (G13) is an aminolysis, which, as a rule, is carried out either in the absence of a solvent [cf. for example J. Soc. Dyes Col. 42 (1926), 81, Ber. 64 (1931), 970; Org. Synth., Coll. Vol. IV (1963), 80 and J. Am. Chem. Soc. 70 (1948), 2402] or in an inert anhydrous solvent or diluent, in particular in an aprotic solvent, for example in an aromatic or haloaromatic, such as toluene, o-, m- or p-xylene or chlorobenzene.

It is advisable here to carry out the reaction in the presence of a basic catalyst, for example of a relatively high boiling amine [cf. for example Helv. Chim. Acta 11 (1928), 779 and U.S. Patent 2,416,738] or

pyridine.

The reaction temperature is preferably from about 20 to 160°C.

5 In all three preparation variants, the starting materials are advantageously used in a stoichiometric ratio, or a slight excess of up to about 10 mol % of one or other component is used. If the reaction is carried out in the presence of a basic catalyst, from 0.5 to 200 mol %, based on the amount of a starting material,
10 is generally sufficient.

The subsequent reaction of the resulting compounds of the formula XVII with the compound $H_2N-COOL^1$ is advantageously carried out in a substantially anhydrous solvent or diluent at atmospheric pressure, particularly
15 preferably in the presence of an acidic catalyst.

Particularly suitable solvents or diluents are organic liquids which form azeotropic mixtures with water, for example aromatics, such as benzene, toluene and o-, m- and p-xylene, and halohydrocarbons, such as
20 carbon tetrachloride and chlorobenzene.

Particularly suitable catalysts are strong mineral acids, such as sulfuric acid, organic acids, such as p-toluenesulfonic acid, phosphorus-containing acids, such as orthophosphoric acid and polyphosphoric acid, and
25 acidic cation exchangers, such as Amberlyst 15 (Fluka).

In general, the reaction temperature is from about 70 to 150°C; for rapid removal of the resulting water of reaction, however, the reaction is advantageously carried out at the boiling point of the solvent.

30 The pyrimidinone derivatives IVa and IVb, which are used as starting materials in method d), can be obtained by halogenation, preferably chlorination or bromination, of 3-phenyluracils I in which R^3 is hydrogen, in the absence of a solvent or in the presence of an
35 inert solvent or diluent.

Particularly suitable solvents or diluents are aprotic organic liquids, for example aliphatic or

aromatic hydrocarbons, such as n-hexane, benzene, toluene and o-, m- and p-xylene, halogenated aliphatic hydrocarbons, such as methylene chloride, chloroform and 1,2-dichloroethane, halogenated aromatic hydrocarbons, such as chlorobenzene, or tertiary amines, such as N,N-dimethylaniline.

Particularly suitable halogenating agents are thionyl chloride, phosphorus pentachloride, phosphoryl chloride, phosphorus pentabromide and phosphoryl bromide. A mixture of phosphorus pentachloride and phosphoryl chloride or of phosphorus pentabromide and phosphoryl bromide can also be particularly advantageous.

When thionyl chloride is used as halogenating agent, it is preferable to add a catalytic amount of dimethylformamide.

The amount of halogenating agent is not critical; for complete conversion, at least equimolar amounts of halogenating agent and of the educt to be halogenated are required. However, a 1-fold to 8-fold molar excess of halogenating agent may also be advantageous.

The reaction temperatures are in general from 0°C to the reflux temperature of the reaction mixture, preferably from 20 to 120°C.

The compounds of the formulae IX, XII, XIII and XIV are likewise novel. They can be prepared by conventional methods, particularly advantageously from compounds of the formula XVI:

s) By phosgenation and hydrolysis of the products with ammonia

The process can be carried out in an inert, essentially anhydrous solvent or diluent or in the absence of a solvent, the compounds XVI preferably being reacted with phosgene or trichloromethyl chloroformate.

Particularly suitable solvents or diluents are aprotic, organic solvents, for example aromatics, such as toluene and o-, m- and p-xylene, halohydrocarbons, such as methylene chloride, chloroform, 1,2-dichloroethane and chlorobenzene, aliphatic or cyclic ethers, such as 1,2-dimethoxyethane, tetrahydrofuran and dioxane, and esters, such as ethyl acetate, as well as mixtures of these solvents.

Depending on the aniline derivative XVI used, the addition of a base, such as triethylamine, may be advantageous, for example in from 0.5 to 2 times the molar amount, based on the amount of XVI.

By choosing suitable reaction conditions, both the carbamoyl chlorides XIV and the phenylisocyanates XII can be obtained:

Thus, the carbamoyl chlorides XIV are usually obtained at low temperatures of from about -40 to 50°C, whereas a further increase in the temperature up to the boiling point of the reaction mixture leads predominantly to the formation of the phenylisocyanates XII, which can be reacted with ammonia or with a reactive derivative of

ammonia to give the phenylurea derivatives IX.

t) By reaction with alkali metal cyanates

M[⊕] is one equivalent of a metal ion, in particular an alkali metal ion, such as sodium or potassium.

5 The reaction is carried out in an inert solvent or diluent, for example in an aromatic hydrocarbon, such as toluene or o-, m- or p-toluene, in an aliphatic or cyclic ether, such as tetrahydrofuran or dioxane, in a lower alcohol, such as methanol or ethanol, in water or
10 in a mixture of the stated solvents.

The amount of cyanate is not critical; at least equimolar amounts of aniline derivative XVI and cyanate are required for complete conversion, but an excess of cyanate of up to about 100 mol % may also be
15 advantageous.

The reaction temperature is in general from 0°C to the reflux temperature of the reaction mixture.

u) By reaction with esters XX

20 L⁴ is C₁-C₄-alkyl or phenyl and L⁵ is halogen, preferably chlorine or bromine, C₁-C₄-alkoxy or phenoxy.

Examples of suitable solvents or diluents are aromatic hydrocarbons, such as toluene and o-, m- and

p-xylene, halohydrocarbons, such as methylene chloride, chloroform, 1,2-dichloroethane and chlorobenzene, aliphatic or cyclic ethers, such as 1,2-dimethoxyethane, tetrahydrofuran and dioxane, esters, such as ethyl acetate, alcohols, such as methanol and ethanol, and water or two-phase mixtures of an organic solvent and water.

The reaction is advantageously carried out in the presence of a base, for example of an alkali metal hydroxide, carbonate or alcoholate, such as sodium hydroxide, sodium carbonate, sodium methylate or sodium ethylate, or of a tertiary amine, such as pyridine or triethylamine.

If desired, a catalyst, for example a Lewis acid, such as antimony trichloride, may also be added.

The starting compounds and the base are advantageously used in a stoichiometric ratio, but one or other component may also be present in an excess of up to about 100 mol %.

As a rule, the amount of catalyst is from 1 to 50, preferably from 2 to 30, mol %, based on the amount of aniline derivative XVI used.

The reaction temperature is in general from -40°C to the boiling point of the reaction mixture.

The starting compounds of the formula XVI and their preparation and all other compounds whose preparation is not described explicitly are known from the literature or said compounds can be prepared by conventional methods.

In the abovementioned processes for the synthesis of substituted 3-phenyluracils I, their salts, enol ethers or intermediates, atmospheric pressure or the autogenous pressure of the particular solvent is advantageously used. Lower or higher pressure is possible but usually has no advantages.

Unless stated otherwise, the reagents and starting materials required for the preparation of the

substituted 3-phenyluracils I, Ia and Ib are known or can be prepared by conventional methods.

The particular reaction mixtures are worked up, as a rule, by conventional methods, for example by removing the solvent, distributing the residue in a mixture of water and a suitable organic solvent and isolating the product from the organic phase.

The substituted 3-phenyluracils may be obtained as isomer mixtures, which however can, if desired, be separated into the pure isomers by conventional methods, for example by crystallization or chromatography (if necessary, over an optically active adsorbate). Pure optically active isomers can be synthesized, for example, from corresponding optically active starting materials.

The substituted 3-phenyluracils I, Ia and Ib are suitable as herbicides both in the form of isomer mixtures and in the form of the pure isomers. In general they are well tolerated and therefore selective in broad-leaved crops and in monocotyledon plants.

Depending on the particular application method, the substituted phenyluracils Ia and Ib or the agents containing them can be used in a large number of crop plants for eliminating undesirable plants, the following crops being mentioned as examples:

30 The substituted 3-phenyluracils I, Ia and Ib are also suitable for the desiccation and defoliation of plants. As desiccants, they are particularly suitable for drying out the above-ground parts of crop plants, such as potatoes, rape, sunflowers and soybeans. This permits completely mechanical harvesting of these important crop plants.

35 Also of commercial interest is the facilitation

of harvesting, which is permitted by concentrated dropping or a reduction in the adhesion to the tree in the case of citrus fruits, olives or other species and varieties of pomes, drupes and hard-shelled fruit. The same mechanism, ie. promotion of the formation of abscission tissue between the fruit or leaf part and the shoot part of the plant, is also essential for readily controllable defoliation of crops, for example cotton.

Furthermore, the shortening of the time interval in which the individual cotton plants ripen leads to higher fiber quality after harvesting.

Apart from their herbicidal and defoliant activity, some of the substituted 3-phenyluracils of the formulae I, Ia and Ib can also be used as growth regulators or for controlling pests from the class consisting of the insects, arachnids and nematodes. They can be used for controlling pests in crop protection and in the hygiene, stored materials and veterinary sectors.

5 The active ingredients can be used as such, in the form of their formulations or in the application forms prepared therefrom, for example in the form of directly sprayable solutions, powders, suspensions or
10 dispersions, emulsions, oil dispersions, pastes, dusting agents, broadcasting agents or granules, by spraying, nebulizing, dusting, broadcasting and pouring. The application forms depend entirely on the intended uses; they should in any case ensure a very fine distribution of the novel active ingredients.

15 The formulations are prepared in a known manner, for example by extending the active ingredient with solvents and/or carriers, if desired with the use of emulsifiers and dispersants; where water is used as a diluent, other organic solvents may also be used as
20 auxiliary solvents. Suitable inert assistants for this purpose are essentially mineral oil fractions having a medium to high boiling point, such as kerosene and diesel oil, as well as coal tar oils and oils with vegetable or animal origin, solvents, such as aromatics (eg. toluene
25 or xylene), chlorinated aromatics (eg. chlorobenzenes), paraffins (eg. mineral oil fractions), alcohols (eg. methanol, ethanol, butanol or cyclohexanol), ketones (eg. cyclohexanone and isophorone), amines (eg. ethanolamine, N,N-dimethylformamide or N-methylpyrrolidone) and water;
30 carriers such as ground natural minerals (eg. kaolins, aluminas, talc or chalk) and ground synthetic minerals (eg. finely divided silica or silicates); emulsifiers, such as nonionic and anionic emulsifiers (eg. polyoxy-ethylene fatty alcohol ethers, alkylsulfonates and aryl-
35 sulfonates) and dispersants, such as ligninsulfite waste liquors and methylcellulose.

 Aqueous application forms can be prepared from

emulsion concentrates, dispersions, pastes, wettable powders or water-dispersible granules by adding water. For the preparation of emulsions, pastes or oil dispersions, the substrates, as such or dissolved in an oil or solvent, can be homogenized in water by means of wetting agents, adherents, dispersants or emulsifiers. However, concentrates which consist of active ingredient, wetting agents, adherents, dispersants or emulsifiers and possibly solvents or oil and which are suitable for dilution with water can also be prepared.

Suitable surfactants are alkali metal, alkaline earth metal and ammonium salts of aromatic sulfonic acids, for example lignin-, phenol-, naphthalene- and dibutyl-naphthalenesulfonic acid, and of fatty acids, alkyl- and alkylarylsulfonates, alkylsulfates, lauryl ether sulfates and fatty alcohol sulfates and salts of sulfated hexa-, hepta- and octadecanols, and of fatty alcohol glycol ethers, condensates of sulfonated naphthalene and its derivatives with formaldehyde, condensates of naphthalene or of naphthalenesulfonic acids with phenol and formaldehyde, polyoxyethylene octylphenol ethers, ethoxylated isooctyl-, octyl- or nonylphenol, alkylphenol polyglycol ethers, tributylphenyl polyglycol ethers, alkylaryl polyether alcohols, isotridecyl alcohol, fatty alcohol ethylene oxide condensates, ethoxylated castor oil, polyoxyethylene alkyl ethers or polyoxypropylene, lauryl alcohol polyglycol ether acetal, sorbitol esters, ligninsulfite waste liquors or methylcellulose.

Powders, broadcasting agents and dusting agents can be prepared by mixing or milling the active ingredients together with a solid carrier.

Granules, for example coated, impregnated and homogeneous granules, can be prepared by binding the active ingredients to solid carriers. Solid carriers are mineral earths, such as silica gel, silicas, silicates, talc, kaolin, limestone, lime, chalk, bole, loess, clay,

dolomite, kieselguhr, calcium sulfate, magnesium sulfate, magnesium oxide, milled plastics, fertilizers, such as ammonium sulfate, ammonium phosphate, ammonium nitrate and ureas, and vegetable products, such as grain flours, bark meal, wood meal and nutshell meal, cellulosic powders and other solid carriers.

The concentrations of the active ingredients I, Ia and Ib in the ready-to-use formulations can be varied within wide ranges, for example from 0.0001 to 95% by weight. For use as herbicides or plant growth-regulating agents, concentrations of from 0.01 to 95, preferably from 0.5 to 90, % by weight of active ingredient are preferable. Formulations containing from 0.0001 to 10, preferably from 0.01 to 1, % by weight of active ingredient are suitable for use as insecticides. The active ingredients are used in a purity of from 90 to 100%, preferably from 95 to 100% (according to NMR spectrum).

Examples of such formulations are:

- I. A solution of 90 parts by weight of compound No. 1.1 and 10 parts by weight of N-methyl- α -pyrrolidone, which is suitable for use in the form of very small drops.
- II. A mixture of 20 parts by weight of compound No. 1.2, 80 parts by weight of xylene, 10 parts by weight of the adduct of 8 to 10 mol of ethylene oxide with 1 mol of N-monoethanololeamide, 5 parts by weight of the calcium salt of dodecylbenzenesulfonic acid and 5 parts by weight of the adduct of 40 mol of ethylene oxide with 1 mol of castor oil. By finely distributing the mixture in 100,000 parts by weight of water, a dispersion which contains 0.02% by weight of the active ingredient is obtained.
- III. An aqueous dispersion of 20 parts by weight of compound No. 3.1, 40 parts by weight of cyclohexanone, 30 parts by weight of isobutanol and 20

parts by weight of the adduct of 40 mol of ethylene oxide with 1 mol of castor oil. The mixture of this dispersion with 100,000 parts by weight of water contains 0.02% by weight of the active ingredient.

5

An aqueous dispersion of 20 parts by weight of compound No. 2.1, 25 parts by weight of cyclohexanol, 65 parts by weight of a mineral oil fraction boiling within a range of 210 to 280°C and 10 parts by weight of the adduct of 40 mol of ethylene oxide with 1 mol of castor oil. The mixture of this dispersion with 100,000 parts by weight of water contains 0.02% of the active ingredient.

10

A mixture milled in a hammer mill and consisting of 80 parts by weight of compound No. 3.1, 3 parts by weight of the sodium salt of diisobutyl-naphthalene- α -sulfonic acid, 10 parts by weight of the sodium salt of a ligninsulfonic acid obtained from a sulfite waste liquor and 7 parts by weight of silica gel powder. By finely distributing the mixture in 20,000 parts by weight of water, a spray liquor which contains 0.1% by weight of the active ingredient is obtained.

20

25
VII. An intimate mixture of 30 parts by weight of compound No. 3.3, 92 parts by weight of silica gel powder and 8 parts by weight of liquid paraffin which has been sprayed onto the surface of the silica gel. This formulation gives the active ingredient good adhesion.

30
VIII. A stable aqueous dispersion of 40 parts by weight of compound No. 4.1, 10 parts by weight of the

sodium salt of a phenolsulfonic acid/urea/formaldehyde condensate, 2 parts by weight of silica gel and 48 parts by weight of water, which can be further diluted.

5 IX A stable oily dispersion of 20 parts by weight of compound No. 1.1, 2 parts by weight of the calcium salt of dodecylbenzenesulfonic acid, 8 parts by weight of a fatty alcohol polyglycol ether, 20 parts by weight of the sodium salt of a phenolsulfonic acid/urea/formaldehyde condensate and 68 parts by weight of a paraffinic mineral oil.

10 X. A mixture milled in a hammer mill and consisting of 10 parts by weight of compound No. 2.1, 4 parts by weight of the sodium salt of diisobutyl-naphthalene- α -sulfonic acid, 20 parts by weight of the sodium salt of a ligninsulfonic acid obtained from a sulfite waste liquor, 38 parts by weight of silica gel and 38 parts by weight of kaolin. By finely distributing the mixture in 10,000 parts by weight of water, a spray liquor which contains 0.1% by weight of the active ingredient is obtained.

20 The active ingredients or the herbicidal and plant growth-regulating agents can be applied by the preemergence or postemergence method. The plants are usually sprayed or dusted with the active ingredients or the seeds of the test plants are treated with the active ingredients. If the active ingredients are less well tolerated by certain crop plants, it is possible to use application methods in which the herbicides are sprayed with the aid of the sprayers in such a way that the leaves of the sensitive crop plants are as far as possible not affected while the active ingredients reach the leaves of undesirable plants growing underneath or the uncovered oil surface (post-directed, lay-by).

The application rates of active ingredient are

from 0.001 to 5.0, preferably from 0.01 to 2, kg/ha of active ingredient, depending on the aim of control, the season, the target plants and the stage of growth.

To broaden the action spectrum and to achieve synergistic effects, the substituted 3-phenyluracils I, Ia and Ib can be mixed and applied together with a large number of members of other groups of herbicidal or growth-regulating active ingredients. For example, diazines, 4H-3,1-benzoxazine derivatives, benzothiadiazinones, 2,6-dinitroanilines, N-phenylcarbamates, thiocarbamates, halocarboxylic acids, triazines, amides, ureas, diphenyl ethers, triazinones, uracils, benzofuran derivatives, cyclohexane-1,3-dione derivatives which carry in the 2-position, for example, a carboxyl or carbimino, or quinolinecarboxylic acid derivatives, imidazolinones, sulfonamides, sulfonylureas, aryloxy- and hetaryloxyphenoxypropionic acids and their salts, esters and amides and others are suitable components for the mixture.

The substituted 3-phenyluracils I, Ia and Ib can also be applied together with other crop protection agents, such as herbicides, growth regulators, pesticides, fungicides and bactericides. These agents may be mixed with the novel agents in a weight ratio of from 1 : 100 to 100 : 1, if desired also directly before application (tank mix). Also of interest is the miscibility with mineral salt solutions which are used for eliminating nutrient and trace element deficiencies. Nonphytotoxic oils and oil concentrates may also be added.

Example 1

3-(4-Chloro-3-(2-chloro-2-ethoxycarbonylethen-1-yl)-phenyl)-
2,4-dioxo-6-trifluoromethyl-1,2,3,4-tetrahydropyrimidine

At 0 to 5°C, a solution of 3.7 g of ethyl 3-amino-4,4,4-trifluorocrotonate in 20 ml of toluene was added to a suspension of 0.53 g of sodium hydride in 100 ml of dimethylformamide. After the mixture had been stirred for 30 minutes, a solution of 5.7 g of 4-chloro-3-(α-chloroacrylic acid ethyl ester)-phenyl isocyanate in 30 ml of toluene was added at -30 to -25°C. The mixture was stirred for a further 5 hours at about 20-25°C, followed by hydrolysis with 150 ml of water. The reaction mixture was then neutralized with 10 wt% strength hydrochloric acid (pH = 7), and the aqueous phase was separated and extracted twice, each time with 100 ml of toluene. The combined organic phases were washed three times, each time with 50 ml of water, dried over sodium sulfate and evaporated down. The crude product was stirred with diisopropyl ether, separated off, and washed with diisopropyl ether and ligroin.

M.p.: 202-206°C.

Example 3

3-(4-Chloro-3-(2-chloro-2-ethoxycarbonyl-ethen-1-yl)-phenyl)-2,4-dioxo-1-methyl-6-trifluoromethyl-1,2,3,4-tetrahydropyrimidine

(compound no. 3.1)

A solution of 4.2 g of 3-[4-chloro-3-[2-chloro-2-ethoxy-carbonyl-ethen-1-yl]-phenyl]-2,4-dioxo-6-trifluoromethyl-1,2,3,4-tetrahydropyrimidine in 30 ml of dimethylformamide was added to a suspension of 0.31 g of sodium hydride in 100 ml of dimethylformamide. After stirring for 1 hour, a solution of 1.70 g of methyl iodide in 20 ml of dimethylformamide was dripped in. After stirring for 20 hours at about 20 to 25°C the more readily volatile portions of the reaction mixture were removed under reduced pressure. The

oily residue was taken up with 150 ml of toluene and washed three times, each time with 50 ml of water, after which the diluent was dried, followed by evaporation under reduced pressure. The crude product obtained was stirred with ligroin, then separated again, dried and recrystallized from ethanol; m.p.: 159-160°C.

The following compounds were synthesized analogously:
3-(4-chloro-3-(methoxyoximinomethyl)-phenyl)-2,4-dioxo-1-methyl-6-trifluoromethyl-1,2,3,4-tetrahydropyrimidine; m.p.: 132-134°C (compound no. 3.2);

(compound no. 4.1)

5 ml of water was added to a solution of 1.9 g of 3-(4-chloro-3-(1,3-dioxolan-2-yl)-phenyl)-2,4-dioxo-1-methyl-6-trifluoromethyl-1,2,3,4-tetrahydropyrimidine in 45 ml of glacial acetic acid. After 12 hours' stirring at about 20 to 25°C and a further 5 hours' stirring at 40 to 50°C, 150 ml of water was stirred into the mixture. The precipitate was separated off, washed with water and ligroin, and dried. M.p.: 151-153°C.

Use Examples (herbicidal activity)

The herbicidal activity of the substituted phenyluracils I, Ia and Ib was demonstrated by greenhouse experiments:

The culture vessels used were plastic flower pots containing loamy sand with about 3.0% of humus as the

substrate. The seeds of the test plants were sown separately according to species.

In the preemergence treatment, the active ingredients suspended or emulsified in water were applied, directly after sowing, by means of finely distributing nozzles. The vessels were lightly watered in order to promote germination and growth and were then covered with transparent plastic covers until the plants had begun to grow. This covering ensures uniform germination of the test plants, unless this has been adversely affected by the active ingredients.

For the purpose of the postemergence treatment, the test plants were grown in the test vessels themselves or were planted in the test vessels a few days beforehand. The active ingredients suspended or emulsified in water were not applied until a height of growth of from 3 to 15 cm, depending on the form of growth.

The plants were kept at 10-25°C or 20-35°C, according to species. The test periods extended over from 2 to 4 weeks. During this time, the plants were tended and their reaction to the individual treatments was evaluated.

Rating was based on a scale from 0 to 100. 100 means no emergence of the plants or complete destruction of at least the above-ground parts and 0 means no damage or normal growth.

The plants used in the greenhouse experiments consisted of the following species:

	<u>Botanical name</u>	<u>Common name</u>
30	<i>Abutilon theophrasti</i>	velvet leaf
	<i>Amaranthus retroflexus</i>	redroot pigweed
	<i>Solanum nigrum</i>	black nightshade

At application rates of 0.06 and 0.03 kg/ha, undesirable broad-leaved plants can be very readily controlled with compound No. 3.1 by the postemergence method.

Use Examples (defoliation activity)

The comparative agent used was

A 6,7-dihydrodipyrido[1,2- α :2',1'-c]pyridilium as
the dibromide monohydrate salt (common name:
Diquat®).

The comparative agent was used in the form of the
preformulated commercial product.

The test plants used were young, 4-leaved cotton
plants (without cotyledons) of the Stoneville 825
variety, which were grown under greenhouse conditions
(relative humidity from 50 to 70%; day/night temperature
27/20°C).

USE EXAMPLE 1

The leaves of the young cotton plants were
treated to run-off with aqueous formulations of the
stated active ingredients (with the addition of 0.15% by
weight, based on the spray liquor, of fatty alcohol
alkoxylate Plurafac LF 700). The amount of water applied
was equivalent to 1000 l/h. After 13 days, the number of
dropped leaves and the degree of defoliation in % were
determined. In the case of the untreated control plants,
no dropping of leaves occurred.

Agent containing active ingredient No.	Converted applica- tion rate [kg/ha]	Defoliation
-------------------------------------------	-----------------------------------------	-------------

3.1	0.05	53
	0.10	73
A	0.10	0

The result shows that the novel substituted 3-
phenyluracils I have a very good defoliant effect and are
superior to the commercial product A in this respect.

Use Examples (insecticidal activity)

The insecticidal activity of the compounds of the
general formulae I, Ia and Ib was demonstrated by
the following experiments:

The active ingredients were formulated

- a) as a 0.1% strength solution in acetone or
- b) as a 10% strength emulsion in a mixture of 70% by weight of cyclohexanol, 20% by weight of Nekanil[®] LN (Lutensol[®] AP6, wetting agent having an emulsifying and dispersing action and based on ethoxylated alkylphenols) and 10% by weight of Emulphor[®] EL (Emulan[®] EL, emulsifier based on ethoxylated fatty alcohols)

and were diluted to the desired concentration with acetone in the case of a) and with water in the case of b).

After completion of the experiments, the lowest concentration in each case at which the compounds still caused 80-100% inhibition or mortality (activity threshold or minimum concentration) in comparison with untreated control experiments was determined.
